

# Progress Report

Iteration 3 we got the most done. We made the UI look beautiful by utilizing the bootstrap classes and components. In our design document we have screenshots of how the UI looks at different points of the site. We also show the progression of inputting text into the create post tab and the result of the post being put on the page. All of our GET/POST routes on the flask server are up and running and control the content of the webpage effectively. The club told us what descriptions they want on each page, so we wrote up a temporary description for each page. They gave us team pictures to put on each team page and this allows the user of the website to know what team they are viewing. The posts on the team pages are shown in ascending order of most recent to oldest. We are working on signing in and signing out. When the user clicks the sign in button, the page is supposed to be redirected to a page where the user enters their username and password. Overall, we tied together the backend and frontend and have a fully functional deployable website for the Cougs in Space Club.
